

DOCUMENT ID: COMP-6632-REV-10 (State-Specific Compliance and Disclosure Matrix for Service and Claims Content)

Last Updated: 07/31/2026 14:50:00 EST | Author: Compliance_KM_Admin | Status: Approved (Pending Legal Q1 Validation)

Supersedes: COMP-6632-REV-9, DISC-MATRIX-2024, MEMO-2025-STATE-LANGUAGE. Target Audience: Knowledge Authors, Compliance Reviewers, Service Operations Leads, Claims Operations Leads, Content Approvers.

Overview & Scope: This document provides the required state-specific disclosures, handling notes, script dependencies, effective-date considerations, and downstream content impacts that must be reflected in operational knowledge content used by front-line teams. It is not intended to replace product-specific procedures or legal memoranda. Instead, it serves as the controlling cross-reference used to validate whether required state language has been incorporated into procedures, scripts, FAQs, job aids, and training support content. Failure to use this matrix during authoring or review may result in omitted disclosures, inconsistent legal wording, improper script deployment, audit findings, customer complaints, regulatory exposure, and retroactive content remediation.

Usage Standard: Authors and reviewers **MUST** check this matrix whenever a new article or update affects customer-facing language, underwriting logic, claim intake handling, cancellation processing, payment handling, or product eligibility communication. Review the policy state, garaging state, risk location state, and operational scenario before deciding whether a disclosure is required. Do not assume the customer mailing address alone determines applicable language. Where the matrix references a script ID, legal memo, or addendum requirement, that dependency must be validated before publication.

State Matrix (Summary View): Alabama (AL): Standard handling; no additional disclosure unless product memo applies. Alaska (AK): Driver education or seasonal use disclosures may apply depending on line of business. Arizona (AZ): Weather-related exclusion or glass handling wording may be required in specific claim or service contexts. Arkansas (AR): Standard. California (CA): CRITICAL - Prop 103-sensitive pricing, consumer choice, and discount disclosures require strict use of approved script references; do not paraphrase. Colorado (CO): CAT and hail-related claim language may require event-specific routing references. Connecticut (CT): Vehicle damage and waiver limitations may require product-specific notice text. Delaware (DE): Standard. Florida (FL): Driving record, injury/PIP, and cancellation timing language frequently requires state-script validation; do not publish updates without legal review. Georgia (GA): Standard unless underwriting memo applies. Hawaii (HI): Standard. Idaho (ID): Standard. Illinois (IL): Certain system coding or rating impacts require explicit agent/internal instruction in procedures. Indiana (IN) to Kansas (KS): Standard absent product memo. Kentucky (KY) to Maryland (MD): Standard. Massachusetts (MA): Safe driver or regulatory notice language may

apply in selected service and claims scenarios. Michigan (MI): No-fault and RMV-related references require scenario validation. Minnesota (MN): PIP or coverage-extension notes may affect operational content. Mississippi (MS) to New Mexico (NM): Standard. New York (NY): Defensive driving, no-fault, and timing-sensitive customer notice requirements must be monitored closely and updated immediately when legal guidance changes. North Carolina (NC) to Oregon (OR): Standard. Pennsylvania (PA): Tiering and tort-election references may require controlled wording. Rhode Island (RI) to Tennessee (TN): Standard. Texas (TX): Signed addendum, acknowledgment, or follow-up document triggers may apply in exclusion or endorsement contexts. Utah (UT) to Wyoming (WY): Standard.

Downstream Content Impact Rules: When a state-specific change is approved, authors must identify every affected procedure, FAQ, script, job aid, and training support article. It is not sufficient to update only the primary procedural article if a required disclosure also appears in a script article or quick-reference aid. If a disclosure is deprecated, remove or replace the language everywhere it appears and record the effective date in the change log. If a disclosure is date-bound, verify that active date ranges and superseded references are documented before publication.

Change Management Sequence: Compliance identifies change -> KM logs impact -> owning business area validates operational usage -> required script or article revisions are drafted -> legal/compliance approves wording -> content operations publishes in sequence -> audit sample confirms downstream consistency. Emergency legal updates must be prioritized over routine content optimization work.

Key Risks / Common Failures: outdated script IDs remaining in active articles; state-specific language buried inside generic procedures; authors paraphrasing required wording; delayed propagation of changes to job aids; lack of visibility into which live articles consume a disclosure; and inability to prove which language was active on a specific date.

Documentation Notes: This matrix intentionally mirrors the dense, cross-referenced legacy style used in document-centric environments where compliance dependencies, article references, and effective-date logic are managed manually in large reference documents.
